AMPL: Work Scheduling Example

Cover demands for workers

- * Each "shift" requires a certain number of employees
- * Each employee works a certain "schedule" of shifts
- * Each schedule that is worked by anyone must be worked by a fixed minimum number

Minimize total workers needed

- * Which schedules are used?
- How many work each of schedule?

Algebraic modeling language: symbolic data

```
set SHIFTS;  # shifts

param Nsched;  # number of schedules;
set SCHEDS = 1..Nsched;  # set of schedules

set SHIFT_LIST {SCHEDS} within SHIFTS;

param rate {SCHEDS} >= 0;  # pay rates
param required {SHIFTS} >= 0;  # staffing requirements

param least_assign >= 0;  # min workers on any schedule used
```

Algebraic modeling language: symbolic model

```
var Work {SCHEDS} >= 0 integer;
var Use {SCHEDS} >= 0 binary;
minimize Total Cost:
   sum {j in SCHEDS} rate[j] * Work[j];
subject to Shift_Needs {i in SHIFTS}:
   sum {j in SCHEDS: i in SHIFT_LIST[j]} Work[j] >= required[i];
subject to Least_Use1 {j in SCHEDS}:
   least_assign * Use[j] <= Work[j];</pre>
subject to Least_Use2 {j in SCHEDS}:
   Work[j] <= (max {i in SHIFT_LIST[j]} required[i]) * Use[j];</pre>
```

Explicit data independent of symbolic model

```
set SHIFTS := Mon1 Tue1 Wed1 Thu1 Fri1 Sat1
             Mon2 Tue2 Wed2 Thu2 Fri2 Sat2
             Mon3 Tue3 Wed3 Thu3 Fri3;
param Nsched := 126;
set SHIFT_LIST[1] := Mon1 Tue1 Wed1 Thu1 Fri1 ;
set SHIFT_LIST[2] := Mon1 Tue1 Wed1 Thu1 Fri2 ;
set SHIFT_LIST[3] := Mon1 Tue1 Wed1 Thu1 Fri3 ;
set SHIFT_LIST[4] := Mon1 Tue1 Wed1 Thu1 Sat1 ;
set SHIFT_LIST[5] := Mon1 Tue1 Wed1 Thu1 Sat2 ;
                  Mon1 100 Mon2 78 Mon3 52
param required :=
                  Tue1 100 Tue2 78 Tue3 52
                  Wed1 100 Wed2 78 Wed3 52
                  Thu1 100 Thu2 78 Thu3 52
                  Fri1 100 Fri2 78 Fri3 52
                  Sat1 100 Sat2 78;
```

Solver independent of model & data

                                                          0s
Solved in 35 iterations and 0.00 seconds
Optimal objective 1.200000000e+01
Gurobi 3.0.0: node limit; objective 12
609669 simplex iterations
10161 branch-and-cut nodes
plus 35 simplex iterations for intbasis
```

2: Know When to Quit

Difficult situations

- Work scheduling without log lines
- Work scheduling with log lines
- ❖ Balanced assignment: a complete failure

Can we stop early?

- In these cases: good bet
- ❖ In general: not so clear

Work Scheduling Without Log Lines

A day of CPLEX output

```
ampl: model sched1.mod;
ampl: data sched.dat;
ampl: let least_assign := 19;
ampl: option solver cplex;
ampl: option cplex_options 'branch 1';
ampl: solve;
252 variables:
        126 binary variables
        126 integer variables
269 constraints, all linear; 1134 nonzeros
1 linear objective; 126 nonzeros.
CPLEX 12.1.0: branch 1
```

Work Scheduling With Log Lines

CPLEX starts promisingly . . .

Stopping Early

1st example

- optimum is either 269 or 268
- solution with 269 is known
- isn't that good enough?

2nd example

- gap is still huge, but . . .
- solution with 212 seems likely to be optimal

... we'll return to these

The trouble with this reasoning

- not robust over a range of similar problems
- could be wrong when gap is large

3: Multiprocess

Predictable effects

Process branch-and-bound nodes faster

Unpredictable effects

* Build a different tree

Work scheduling examples . . .

6.45 seconds

Improved Settings (cont'd)

Results using mixed-integer formulation

- ❖ With defaults: 159.2 sec, 85629 nodes, 1408458 iters
- ❖ After tuning: 6.45 sec, 9878 nodes, 165097 iters

Settings for tuned run

- ❖ cutpass = 1
- ♦ heurfreq = -1
- ❖ probe = -1
- ❖ varsel = 4

... same result with default of probe = 0

Is Tuning Worthwhile?

Yes, sometimes

Default settings are not always so good

But...

- Chance may play a role
- ❖ No settings may be consistently better

And you could always...

Paper at this year's CPAIOR conference

- Frank Hutter, Holger H. Hoos, Kevin Leyton-Brown,
 Automated Configuration of
 Mixed Integer Programming Solvers
- ❖ We study the application of an automated algorithm configuration procedure to different MIP solvers, instance types and optimization objectives. We show that this fully-automated process yields substantial improvements to the performance of three MIP solvers: CPLEX, GUROBI, and LPSOLVE. Although our method can be used "out of the box" without any domain knowledge specific to MIP, we show that it outperforms the CPLEX special-purpose automated tuning tool.

CPLEX 11.	2.0: ran	out of mem	ory.				

Tighter Formulation 1

Definition of overlap for person i

- ➤ maxOverlap[i] must be ≥ greatest overlap possible
- ➤ Smaller values give stronger b&b lower bounds

```
* theoretically correct: 4 * (maxInGrp-1) → 0.0
* empirically justified: 1 * (maxInGrp-1) → 156.8 (26.0%)
```

Tighter Formulation 2

Symmetry constraint (a)

```
subject to BreakSymm1
    {i in FIRST_PEOPLE, j in ord(i,FIRST_PEOPLE)+1..numberGrps}:
        Assign[i,j] = 0;
```

- > choose the first (numberGrps-1) people in some way
- \triangleright assign the *i*th person to one of the first *i* groups

Tighter Formulation 2 (cont'd)

Symmetry constraint (b)

- ➤ identify "types" of people who are identical in all four characteristics
- > order the people of each type, and order the groups
- with each type, assign higher-numbered people to higher-numbered groups

Tighter Formulation 2 (cont'd)

Symmetry strategies

- > BreakSymm1 increases the b&b lower bound a bit
- BreakSymm2 does not increase the lower bound
- > CPLEX's symmetry directive is more effective
 - * set symmetry=5 for greatest symmetry-breaking effort

Tighter Formulation 3

Group size limits

```
subj to GroupSize {j in 1..numberGrps}:
   minInGrp <= sum {i in PEOPLE} Assign[i,j] <= maxInGrp;</pre>
```

- miningrp must be smaller than group size average
- maxingrp must be larger than group size average
- ➤ Tighter limits give stronger b&b lower bounds

```
* floor(card(PEOPLE)/numberGrps) - 1 ceil (card(PEOPLE)/numberGrps) + 1 \rightarrow 156.8 (26.0%)
```

```
* floor(card(PEOPLE)/numberGrps)
ceil (card(PEOPLE)/numberGrps) → 177.6 (16.2%)
```

Tighter Formulation 3 (cont'd)

Group sizes

```
param minInGrp := floor (card(PEOPLE)/numberGrps);
param nMinInGrp := numberGrps - card{PEOPLE} mod numberGrps;
subj to GroupSizeMin {j in 1..nMinInGrp}:
    sum {i in PEOPLE} Assign[i,j] = minInGrp;
subj to GroupSizeMax {j in nMinInGrp+1..numberGrps}:
    sum {i in PEOPLE} Assign[i,j] = minInGrp + 1;
```

Compute exact sizes of all groups

```
* min, max sizes \rightarrow 177.6 (16.2%)
```

```
* exact sizes \rightarrow 183.36 (13.5%)
```

```

Reconceived Formulation

Different variables

- ➤ Min of each type in any group
- ➤ Max of each type in any group

Different objective

➤ Sum of (max – min) over all types

6: "Cheat" on the method

Work scheduling revisited . . .

Cover demands for workers

- * Each "shift" requires a certain number of employees
- * Each employee works a certain "schedule" of shifts
- * Each schedule that is worked by anyone must be worked by a fixed minimum number

Minimize total workers needed

- ❖ Which schedules are used? Use[j] vars
- ❖ How many work each of schedule? Work[j] vars

Work Scheduling Revisited

Direct approach

- Apply branch-and-bound to whole problem
- Branch "up" first

Indirect approach

- Step 1: Relax integrality of Work variables Solve for zero-one Use variables
- Step 2: Fix Use variables
 Solve for integer Work variables

... not necessarily optimal, but ...

Work Scheduling Revisited

Typical run of indirect approach

```
ampl: model sched1.mod; data sched.dat;
ampl: let least_assign := 16;
ampl: option solver cplex;
ampl: option cplex_options 'branch 1';
ampl: let {j in SCHEDS} Work[j].relax := 1;
ampl: solve;
CPLEX 11.2.0: optimal integer solution; objective 265.6
870496 MIP simplex iterations
55911 branch-and-bound nodes
ampl: fix {j in SCHEDS} Use[j];
ampl: let {j in SCHEDS} Work[j].relax := 0;
ampl: solve;
CPLEX 11.2.0: optimal integer solution; objective 266
24 MIP simplex iterations
4 branch-and-bound nodes
```

Work Scheduling: Hard Case

CPLEX 12.1

❖ Direct: 465,596,558 nodes, 112013 seconds

❖ Indirect: 6,886,122 nodes, 617 seconds

Gurobi 3.0 beta

❖ Direct: 1,330,555,419 nodes, 69945 seconds

❖ Indirect: 6,354,683 nodes, 299 seconds

Observations

- step 1 gives fractional solution
- * step 2 trivially easy and rounds up step 1 objective

... hence optimal

7: "Cheat" on the data

Cut large "raw" rolls into smaller ones

- * All raw rolls the same width
- Various smaller widths ordered
- Varying numbers of widths ordered

Minimize total raw rolls cut

- ❖ By generating patterns during optimization
- ❖ By enumerating patterns in advance

Roll Cutting

Cutting model

```
set WIDTHS;
                                         # set of widths to be cut
                                         # number of each width to be cut
param orders {WIDTHS} > 0;
param nPAT integer >= 0;
                                         # number of patterns
param nbr {WIDTHS,1..nPAT} integer >= 0; # rolls of width i in pattern j
var Cut {1..nPAT} integer >= 0;
                                         # rolls cut using each pattern
minimize Number:
   sum {j in 1..nPAT} Cut[i];
                                      # total raw rolls cut
subject to Fill {i in WIDTHS}:
   sum {j in 1..nPAT} nbr[i,j] * Cut[j] >= orders[i];
                                         # for each width,
                                         # rolls cut meet orders
```

Pattern generation model

```
param roll_width > 0;
param price {WIDTHS} default 0.0;
var Use {WIDTHS} integer >= 0;
minimize Reduced_Cost:
    1 - sum {i in WIDTHS} price[i] * Use[i];
subj to Width_Limit:
    sum {i in WIDTHS} i * Use[i] <= roll_width;</pre>
```

Pattern generation script

```
repeat {
    solve Cutting_Opt;
    let {i in WIDTHS} price[i] := Fill[i].dual;
    solve Pattern_Gen;
    if Reduced_Cost < -0.00001 then {
        let nPAT := nPAT + 1;
        let {i in WIDTHS} nbr[i,nPAT] := Use[i];
        }
    else break;
    };</pre>
```

Pattern enumeration script

```
repeat {
   if curr_sum + curr_width <= roll_width then {</pre>
      let pattern[curr_width] := floor((roll_width-curr_sum)/curr_width);
      let curr_sum := curr_sum + pattern[curr_width] * curr_width;
   if curr_width != last(WIDTHS) then
      let curr_width := next(curr_width,WIDTHS);
   else {
      let nPAT := nPAT + 1;
      let {w in WIDTHS} nbr[w,nPAT] := pattern[w];
      let curr_sum := curr_sum - pattern[last(WIDTHS)] * last(WIDTHS);
      let pattern[last(WIDTHS)] := 0;
      let curr_width := min {w in WIDTHS: pattern[w] > 0} w;
      if curr_width < Infinity then {
         let curr_sum := curr_sum - curr_width;
         let pattern[curr_width] := pattern[curr_width] - 1;
         let curr_width := next(curr_width,WIDTHS);
      else break;
```

Sample data

```
param roll_width := 172 ;
param: WIDTHS: orders :=
       25.000
                   5
       24.750
                  73
       18,000
                  14
       17,500
       15.500
                  23
       15.375
       13.875
                  29
       12,500
                  87
       12.250
                  31
       12.000
       10.250
       10.125
                  14
       10.000
                  43
        8.750
                  15
        8.500
                  21
        7.750
```

... Robert W. Haessler, "Selection and Design of Heuristic Procedures for Solving Roll Trim Problems" Management Science 34 (1988) 1460–1471, Table 2

Roll Cutting Results

Patterns generated during optimization (Gilmore-Gomory procedure)

- > 32.80 rolls in continuous relaxation
- ➤ 40 rolls rounded up to integer
- > 34 rolls solving IP using generated patterns

All patterns enumerated in advance

> 27,338,021 non-dominated patterns — too big

Every 100th pattern saved

- > 273,380 patterns
- ➤ 33 rolls solving IP using enumerated patterns
- > 50 seconds: b&b heuristic solves at root (no cuts)

... takes much longer to generate than solve
